Summary

Full Stack Engineer with over 5 years of experience in building scalable and high-performance software solutions. Skilled in using **Java** along with **Spring Boot** and **Microservices** to develop backend systems while creating user-friendly frontend applications with **Angular** and **TypeScript**. Experienced in modernizing legacy systems into microservices and securing applications by using **OAuth2** and **Spring Security**. Proficient in working with cloud platforms like **AWS** and tools such as **Docker**, **Kubernetes**, and **Jenkins** to automate deployments and improve system reliability. Strong expertise in optimizing databases by using **Hibernate**, **JPA**, and tuning techniques for **Oracle**, **PostgreSQL**, and **MongoDB**. Adept at handling real-time data processing with **Kafka** and automating infrastructure with **AWS CloudFormation**. A collaborative professional who focuses on **Agile practices**, **SOLID principles**, and **test-driven development** to deliver secure and maintainable solutions.

Technical Skills

Languages	Java 17/11/8, TypeScript, SQL, PL/SQL, JavaScript, HTML5, CSS3, XML, JSON
Frameworks	Spring Boot, Spring MVC, Spring Security, Hibernate, JPA
Web Technologies	Angular 15/14/6, RESTful APIs, SOAP, Microservices, Kafka, JSP, Servlets, AJAX, Web Services, WebSockets
Databases	PostgreSQL, Oracle, MySQL, MongoDB, DynamoDB, DB2, Redis
Cloud & DevOps	AWS (EC2, S3, Lambda, ECS, CloudFormation, CloudWatch), Docker, Jenkins, GitLab, CI/CD, Kubernetes
Tools	IntelliJ, Eclipse, Visual Studio Code, Maven, JUnit, Mockito, Cucumber, Cypress, Postman
Operating Systems	Linux, Windows, Unix
Other Skills	Agile Methodology, OAuth2, Keycloak, API Gateway, Event-Driven Architecture, SOLID Principles

Professional Experience

Thrivent

Minneapolis, MN

Full Stack Engineer

Dec 2023 – Current

Worked on Thrivent's Investment Portfolio Management System to modernize how financial advisors and clients track and manage their investments. The project focused on breaking a monolithic application into smaller services that handled real-time asset tracking, risk analysis, and trade execution. Contributed to building backend services that processed trade orders, updated portfolio values, and calculated investment growth over time. Developed interactive Angular components to visualize financial trends with dynamic charts and reports.

Responsibilities:

- Modernized legacy applications by refactoring monolithic code into microservices using Java 17 with sealed classes and pattern matching for better maintainability.
- Designed RESTful APIs with Spring Boot to facilitate communication between microservices and Angular-based frontend applications ensuring data consistency.
- Built reusable Angular 15 components using TypeScript and dependency injection to enhance frontend modularity and reduce development time.
- Implemented Spring Security with OAuth2 for role-based access control and secure authentication across microservices to protect sensitive data.
- Utilized Apache Kafka for event-driven architecture to process real-time data streams and generate alerts for abnormal patterns improving system responsiveness.
- Deployed containerized applications on AWS ECS using Docker and managed infrastructure with AWS CloudFormation for scalability and reliability.
- Configured Jenkins pipelines for CI/CD to automate deployments and reduce manual errors in the release process ensuring faster delivery cycles.
- Integrated CloudWatch for centralized logging and monitoring to track application performance and troubleshoot issues proactively.
- Optimized database interactions using Hibernate and JPA to reduce query execution time and improve data retrieval efficiency.
- Conducted unit and integration testing with JUnit and Mockito to validate code functionality and ensure reliability.
- Utilized AWS Lambda for serverless computing to process data from S3 and DynamoDB for scalable backend operations.
- Collaborated with cross-functional Agile teams to deliver features on time and align with business requirements.
- Designed and implemented custom message adapters using Kafka to enable efficient data flow between microservices.
- Enhanced frontend performance by implementing lazy loading and optimizing Angular routing for faster page loads.

- Configured API Gateway patterns to manage RESTful API traffic and implement rate limiting for better resource utilization.

Technological Environment:

Java 17, Angular 15, Spring Boot, RESTful APIs, Hibernate, Docker, AWS ECS, Jenkins, Apache Kafka, Oracle, Spring Security, OAuth2, TypeScript, CloudWatch, JUnit, Mockito, CI/CD, Agile, Microservices, AWS Lambda, S3, DynamoDB, PL/SQL, Git, HTML5, CSS3, JSON, XML, IntelliJ, Maven.

Fuse Machine**New York, NY***Full Stack Developer**Jul 2022 – June 2023*

Worked on a Loan Approval System to make loan processing faster and more accurate. The system replaced slow manual workflows with automated credit checks and decision-making. It helped validate applicant information, assess risk, and approve loans based on predefined rules. The platform connects financial institutions and credit bureaus to improve decision-making and meet compliance requirements. Contributed to building microservices, developing RESTful APIs, integrating Kafka for real-time processing, and deploying applications using AWS and Docker.

Responsibilities:

- Developed microservices using Java 11 and Spring Boot to process FAA TFMS data and convert XML to JSON for efficient data handling.
- Built dynamic frontend components with Angular 14 using reactive forms and custom validators to improve user interaction.
- Implemented RESTful APIs to enable communication between microservices and external systems for consistent data exchange.
- Deployed applications on GitLab using CI/CD pipelines to automate integration and deployment processes.
- Configured Keycloak for authentication and authorization in Kubernetes and Docker environments to secure application access.
- Developed Kafka Streams applications for real-time data processing and alert generation to detect abnormal data patterns.
- Integrated Spring Data JPA with Hibernate to optimize database interactions and reduce query execution time.
- Utilized Docker for containerization to ensure consistent deployment across development and production environments.
- Conducted end-to-end testing with Cucumber and Cypress to validate application functionality against business requirements.
- Implemented AWS CloudFormation for infrastructure as code to automate resource provisioning and management.

- Collaborated with product owners and test engineers in Agile sprints to refine test plans and ensure quality assurance.
- Optimized database queries and stored procedures in Oracle to improve data retrieval performance and consistency.
- Utilized AWS services like EC2, S3, and Lambda for deploying and managing microservices in the cloud.

Technological Environment:

Java 11, Angular 14, Spring Boot, RESTful APIs, Kafka, Docker, GitLab, Keycloak, Kubernetes, Spring Data JPA, Hibernate, Oracle, AWS, CloudFormation, CI/CD, Agile, Microservices, Cucumber, Cypress, TypeScript, HTML5, CSS3, JSON, XML, IntelliJ, Maven, JUnit, Mockito.

LeapFrog Technology**Seattle, WA***Software Engineer**Jan 2020 – July 2022*

Worked on a Healthcare Management System to move patient records, appointment scheduling, and billing to a digital platform. The system helped doctors and medical staff manage medical histories, prescriptions, and diagnostic reports more efficiently. It improved coordination between departments by using secure authentication, real-time notifications, and data-sharing features. This helped reduce paperwork and administrative work in hospitals and clinics. Contributed to developing backend services, designing RESTful APIs, optimizing database queries, and implementing authentication using Spring Security.

Responsibilities:

- Developed Spring MVC applications using Java 8 to manage maintenance systems and customer portfolios.
- Built responsive frontend interfaces with Angular 6 using reactive forms and two-way data binding for enhanced user interaction.
- Designed RESTful APIs to enable CRUD operations and ensure seamless data exchange between frontend and backend systems.
- Migrated legacy Java applications from WebSphere to Spring Boot to modernize architecture and improve scalability.
- Deployed applications on AWS using Docker and EC2 to ensure reliable and scalable production environments.
- Implemented Angular Reactive Forms for robust form handling and validation to improve data integrity and user experience.
- Developed microservices using Spring Boot and RESTful APIs to enable modular and scalable application architecture.
- Configured Jenkins pipelines for CI/CD to automate deployment processes and reduce manual errors.
- Integrated Hibernate with Spring for efficient database interactions and optimized data persistence and retrieval.
- Conducted unit testing with JUnit and EasyMock to validate code functionality and ensure reliability.

- Managed SQL queries and stored procedures in Oracle to improve database performance and consistency.
- Collaborated with cross-functional Agile teams to deliver features on time and meet client requirements.

Technological Environment:

Java 8, Angular 6, Spring Boot, RESTful APIs, Spring MVC, Docker, AWS, Jenkins, Hibernate, Oracle, CI/CD, Agile, Microservices, JUnit, EasyMock, SQL, PL/SQL, HTML5, CSS3, JSON, XML, Eclipse, Maven, Git.

AWS Certified Developer – Associate

Skills:

AWS (Lambda, S3, CloudWatch, Elastic BeanStalk), Amazon API Gateway, AWS CloudWatch, AWS SDKs, AWS IAM, Amazon SQS & SNS
